Elevator Pitch

I'm working on a way to help children who are immobile play and move with their families'. Motorized wheel chairs are great for adults but children under the age of three typically can't purchase one that fits their size. I'm building a remote controller, similar to what you might use for an RC car. The controller will allow the parent to override the child's steering and brake. This way the child can learn to operate the vehicle with some supervision while still getting a sense of independence.
